

### 1. Color control of nail polishes

The color of nail varnishes should be controlled. It has to be taken into account that the nail lacquers should be checked through transparent glass bottles. For this purpose a color sensor type **SPECTRO-3-30-POL** is used at a distance of approximately 20mm and the detecting range at this distance is around 12mm in diameter. The nail lacquer bottles can be properly differentiated as shown in the screen shots.
