

1. Color measurement of lacquered metal sheets

The color of painted metal sheets should be measured.

For this purpose a color measurement sensor type **SPECTRO-3-28-45°/0°-MSM-ANA-VIS** will be used.

The distance of the sensor to the painted metal sheets is approximately 28mm. At this, the detecting area has a diameter of around 10mm. The color of the lacquer can be proper measured as shown in the screen shots.
