

Application - News N°62 SPECTRO-3 Series

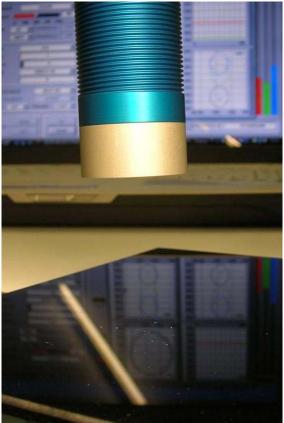

1. Color control of tinted glass plates

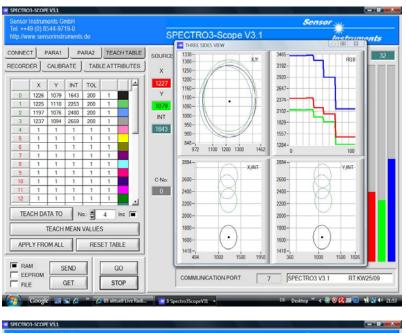

During the assembling of cars the color of the glasses from the side door must be checked. It's only possible to control from one side and even an additional reflector can't be used. With the color sensor **SPECTRO-3-50-FCL** a proper differentiation of the respective tinted or non tinted glasses is possible. The sensor distance to the glass plate is approximately 50 mm.
