

1. Frontside and backside differentiation of a plastic part

The frontside of a flat plastic part should be differentiated from the backside. For this purpose, a haze sensor type **GLAST-85-30°/30°-DIF-1.0/1.0** is used. At this, the distance from the sensor to the plastic part is approximately 85mm. The frontside can be properly differentiated from the backside as shown in the screenshots.
