

1. Color differentiation of interior equipment

In the automotive industry different interior parts (wooden as well as plastic and metal elements) must be differentiated. Some wooden and plastic elements are very glossy whereas other components are diffuse. At this a color sensor type SPECTRO-3-30-POL will be used.

The distance from the sensor to the object is approximately 30 mm. As shown in the screen shots, a proper differentiation of all of the seven components is possible.
