

1. Differentiation between front side and back side of closures

During the production of dispenser – containers for moist wipes the closure site must be controlled. At this a color sensor type **SPECTRO-3-30-POL** is used to control, whether the front side or the back side of the closure is on the top. The distance from the sensor to the closure surface is approximately 30 mm. The system is running in the **DYN1** teach mode, which allows an easy adjustment after a product change.
