

### 1. Differentiation of front side and backside of canvas

The front side of canvas should be differentiated from the backside. For this purpose, a color sensor type **SPECTRO-3-50-FCL-30°/30°** is used. At this, the distance from the sensor to the object is approximately 85mm and the detecting range at this distance is around 20mm in diameter. The front side can be proper differentiated from the backside of the canvas as shown in the screenshots.
