

1. Fiber optic color sensor with analog and digital outputs: SPECTRO-3-FIO-ANA

The color sensor **SPECTRO-3-FIO-ANA** comes with three analog outputs as well as two digital outputs. Thus RGB, siM as well as xyINT are selectively available at the three outputs as 0V to 10V analog signals. Furthermore three colors can be taught and sent to the two digital outputs (binary coded) or two colors (direct). There is the whole FIO series available for this color sensor type. The color sensor can be parameterized via the Windows® software **SPECTRO3-ANA-Scope V1.0**.
