

1. Holding fixture type SPECTRO-3-28-45°/0°-CALFRAME for calibration of color measurement sensor SPECTRO-3-28-45°/0°-MSM-ANA

The holding fixture **SPECTRO-3-28-45°/0°-CALFRAME** allows in connection with a color chart an easy calibration of the color measurement sensor type **SPECTRO-3-28-45°/0°-MSM-ANA**. The distance of the color sensor (placed in the holding fixture) to the surface of the color chart is equal to the reference distance of 28mm. During the calibration, the respective color field should be placed directly under the white light spot of the color measurement sensor. With the calibration software tool (a part of the MSM software) up to 64 different reference colors can be stored. It has to be taken into account that the adequate reference color field is in minimum a bit larger than the white light spot.
